PROJECT ANALYSIS REPORT

WHAT THE DASHBOARD ANALYSED, WHAT IT FOUND & WHO BENEFITS

UAE RETAIL & FMCG • KPI GUIDE • FINDINGS • BUSINESS & SHOPPER VALUE

A practical explanation of the report's measures, visible findings and the potential value for management and end customers.

Primary audience: Retail management, store operations, merchandising, inventory and customer teams.

Interpretation rule: Figures are from the current dashboard screenshot and project details. The dataset is synthetic. Findings are descriptive; causes and real-world impact require further evidence.

01 · ANALYSIS SCOPE

What was actually analysed

The Overview page contains the headline KPIs and visible sales breakdowns. Supporting pages provide deeper analysis by business area.

Area	What is examined	What users can learn
Overall sales	Revenue, gross profit, GP%, transactions, ABV and monthly trend.	How sales and gross-profit performance are moving.
Stores	Revenue and store-level comparisons.	Which stores contribute more revenue and which need deeper review.
Products	Category and product contribution.	Which parts of the assortment contribute most to sales.
Sales channels	Revenue split across Store, App and Web.	How much business comes from each displayed channel.
Inventory	Stock position and stock-related indicators where available.	Where potential low, excess or slow-moving stock should be investigated.
Wastage	Recorded wastage and breakdowns supported by the dataset.	Where recorded losses are concentrated.
Customers	Customer and basket patterns where customer identifiers and transaction fields support it.	What available records suggest about purchasing behaviour.

Not final dashboard pages: Suppliers and Promotions were removed. Do not claim supplier scorecards or promotion ROI analysis are included in the final report.

02 · KPI REFERENCE

Key performance indicators explained

Use these definitions consistently when discussing the project in an interview.

KPI	Calculation / definition	What it tells the business
Revenue	SUM(net_sales_aed)	Net sales value in AED using the project's sales definition.
Gross Profit	SUM(gross_profit_aed)	Revenue remaining after the product cost represented in the dataset; not net profit after operating expenses.
Gross Profit %	Gross Profit ÷ Revenue × 100	The share of revenue represented by gross profit; useful for comparing stores and categories.
Transactions	Distinct count of sale_id	Number of bills. Do not count Sales_Items rows as transactions.
Average Basket Value	Revenue ÷ Transactions	Average net sales per bill; changes with price, product mix, units or customer behaviour.
Revenue by Category	Net sales grouped by category	Shows category contribution to revenue.
Revenue by Store	Net sales grouped by store	Shows store contribution and supports location comparisons.
Revenue by Channel	Net sales grouped by channel	Shows Store, App and Web contribution.
Monthly Revenue Trend	Net sales grouped by month	Shows changes across the reporting period.

Examples: GP% = AED 4.26M ÷ AED 14.97M × 100 ≈ 28.47%. ABV = AED 14.97M ÷ approximately 100,000 transactions ≈ AED 149.70.

03 · HEADLINE RESULTS

What the current Overview page shows

Values below are rounded as displayed in the Executive Overview.

Measure	Displayed result	Plain-language meaning
Revenue	AED 14.97 million	Approximate net sales recorded in the reporting period.
Gross Profit	AED 4.26 million	Gross profit after the product cost represented in the dataset.
Gross Profit %	28.47%	About AED 28.47 gross profit for every AED 100 of revenue under this calculation.
Transactions	Approximately 100,000	Around 100K bills / transactions.
Average Basket Value	AED 149.70	Average net sales value per transaction.

How to read the KPIs together

Revenue describes the scale of sales. Gross Profit and GP% add a profitability perspective. Transactions show the number of bills, while ABV shows the average value per bill. Together, they provide more context than revenue alone.

Important: Gross profit is not net profit. The AED 4.26M does not mean rent, salaries, utilities, marketing, finance costs or tax have been deducted.

04 · MAJOR VISIBLE FINDINGS

What patterns can be reported confidently

These findings are supported by the current Overview screenshot. The report does not establish the underlying causes.

Finding	Dashboard evidence	Interpretation / next check
Beverages is the largest visible category bar.	Approximately AED 1.84M revenue.	A major revenue contributor. Check margin, availability and stock before changing the range.
Top visible store revenue bars.	Marina Grand AED 2.42M; Khalidiya AED 2.28M; Al Barsha AED 2.20M.	These lead on revenue in the screenshot. Compare profit, margin and targets before calling one the best overall.
Store is the dominant channel.	About AED 13.56M or 90.6% of revenue.	The displayed mix is strongly store-led. The chart does not explain why App and Web are smaller.
Monthly performance is shown.	January–December trend visual.	Identify periods for investigation alongside seasonality, promotions and stock availability if relevant data exists.

What cannot be concluded

- The highest-revenue store is necessarily the most profitable or efficient.
- A high-revenue category also has the highest margin.
- The dashboard itself caused sales or profit to increase.
- Smaller App or Web sales are caused by a specific problem.
- Customer satisfaction, stock availability or wastage improved without before-and-after evidence.

Analyst habit: Separate “what the data shows” from “why it may be happening.” The first is a finding; the second is a hypothesis to investigate.

05 · DIRECT BUSINESS VALUE

How the retailer benefits from this report

The direct customer of the BI report is the retailer's management and operational teams.

Business user	How the report helps	Potential benefit
Owner / senior management	One overview of revenue, gross profit, margin, transactions and ABV.	Quicker performance reviews and a shared view of results.
Store managers	Store comparisons and monthly trends.	Earlier identification of locations or periods needing investigation.
Category / merchandising	Category and product contribution.	Better-informed assortment, display and product-mix discussions.
Inventory / replenishment	Stock-related indicators and inventory views.	More focused review of availability, excess and slow-moving stock.
Operations / quality	Wastage patterns and breakdowns.	Targeted investigation of recurring loss areas.
Customer / marketing teams	Customer and basket analysis where supported.	Better evidence for understanding purchasing patterns and planning engagement.

Practical management uses

- Review revenue and gross profit together rather than focusing on sales volume alone.
- Compare stores with consistent KPIs and investigate unusual differences.
- Prioritize important categories while checking margin and availability.
- Use stock and wastage indicators to target operational reviews.
- Measure KPIs after an action to see whether the expected improvement occurred.

Business benefit: The report can reduce manual consolidation, improve visibility and support more consistent decisions. Actual time or financial savings must be measured in the retailer's operation.

06 · SHOPPER VALUE

How the report can benefit end customers

Shoppers do not normally use the management dashboard directly. They may benefit indirectly when the retailer acts on the analysis.

Potential shopper benefit	How analysis could contribute	What must happen
Better product availability	Inventory analysis may flag products at risk of stockout.	Teams act on the indicators and maintain suitable reorder levels.
More relevant product range	Category/product analysis may show what sells.	Merchandising teams combine findings with local demand and customer feedback.
Fresher products	Wastage analysis may reveal recurring expiry or handling losses.	Teams improve ordering, rotation, storage and expiry monitoring.
More consistent store experience	Store comparisons may highlight performance differences.	Managers investigate causes and share effective practices.
More relevant engagement	Basket/customer patterns may reveal purchasing behaviour.	Marketing teams use valid insights responsibly and test whether campaigns help shoppers.

Direct versus indirect benefit

Direct benefit to the retailer: clearer performance visibility, consistent comparisons and better-targeted operational investigations.

Indirect benefit to shoppers: potentially better availability, a more relevant assortment, fresher products and a more consistent store experience—if management acts on the findings.

Do not overclaim: The current project does not directly measure customer satisfaction, waiting time, product availability improvement or price reductions. These are potential outcomes, not measured results.

07 · INSIGHT TO ACTION

How a manager can use the report

Step	Example	Evidence / measure
1. Observe	A store's revenue is lower than comparable stores, or a category contributes strongly.	Overview visuals and filters.
2. Investigate	Check transactions, ABV, GP%, product mix, inventory and wastage.	Supporting pages and SQL results.
3. Form a hypothesis	A decline may relate to fewer bills, lower basket value or availability.	Do not assume the cause from the overview alone.
4. Take action	Review replenishment, assortment, pricing or store execution.	Record action, owner and date.
5. Measure	Compare suitable periods before and after the action.	Revenue, GP%, transactions, ABV and relevant stock/wastage measures.

Example: category management

The overview shows Beverages at approximately AED 1.84M revenue. This identifies the category as important in the dataset. A manager should next check category gross profit, product-level contribution, stock availability and wastage before deciding whether to expand the range, change displays or adjust replenishment.

Example: store management

Marina Grand Hypermarket is shown at approximately AED 2.42M revenue. This is a revenue ranking, not a complete store scorecard. The next step is to compare gross profit, GP%, transaction count, ABV and targets.

Key lesson: A KPI highlights where to look. Further analysis explains what may be happening. Follow-up measurement tells whether the action worked.

08 · INTERVIEW EXPLANATION

How to explain the analysis clearly

Use this when asked: “What did your project actually analyse, and what value does it provide?”

“The project analyses a synthetic UAE multi-store retail dataset using SQL Server and Power BI. The Executive Overview tracks revenue, gross profit, gross profit percentage, transactions and average basket value. It also breaks revenue down by category, store and sales channel and shows the monthly trend. Supporting pages focus on stores, products, inventory, wastage and customers. The current overview displays about AED 14.97 million in revenue, AED 4.26 million gross profit, a 28.47% gross profit margin, around 100,000 transactions and AED 149.70 average basket value. The visible charts show Beverages as a leading category, identify the highest-revenue stores and show that the Store channel contributes most of the sales. Management can use these insights to decide where to investigate product mix, store performance, stock and wastage. Shoppers may benefit indirectly if those decisions improve availability, assortment and freshness. The dataset is synthetic, and those customer benefits would need to be measured in a real business.”

Questions to prepare

Who is the customer of this dashboard?

Primarily retailer management and operational teams. Shoppers may benefit indirectly from decisions informed by the report.

Does AED 4.26M mean net profit?

No. It is gross profit under the dataset's definition and does not deduct operating expenses.

Why is ABV useful?

It shows average net sales per bill. Review it with transaction count to understand whether revenue changes come from more bills or larger baskets.

Does high store revenue mean that store is the best?

Not necessarily. Compare gross profit, GP%, targets and operational context.

How does this benefit shoppers?

Potentially through availability, assortment, freshness and consistency, but only after action and measurement.

What are the limitations?

Synthetic data, no causal proof from descriptive charts, and no direct measurement of customer satisfaction or realized improvements.

Final takeaway: The project turns retail data into understandable performance measures. Its value is helping users see where performance is strong, where further investigation may be needed and how to measure the effect of actions.

Personal notes

Add exact SQL queries, DAX measures and page-specific observations from your final PBIX before interview practice.
